

Davies Turner Keeps Web Traffic Moving With Forcepoint

When this growing transport service company found it needed a more robust security solution that allowed for appropriate employee web usage, customized user access, and powerful reporting, it chose Forcepoint Web Security.

Challenges

- The freight services and online tracking business required employees to regularly use the web for everyday work-related tasks, creating risk to the network.
- Different user requirements across a number of offices required an easy-to-customize solution.
- HR team requested increased insight and reporting of time spent online.
- The existing solution did not work for the size the company had grown to: it was not user-friendly and could not provide the depth of information needed.

Approach

- To better safeguard and manage internet access, Morris chose to implement Forcepoint Web Security.

Results

- Through exceptionally granular and efficient reporting, Forcepoint enabled the organization to create both in-depth reports and high-level overviews to help detect potential misuse and highlight security loopholes.
- Forcepoint ensures that the company's Acceptable Usage Policy is adhered to automatically.
- The company can simply and easily create access policies by levels of management.
